

File Upload Vulnerabilities Extra

Introduction

Now that you have completed all previous exercises, return to the earlier labs - **but do not repeat them step by step**. Instead, try the following:

- approach the exploitation from a different angle
- attempt to access alternative files on the server
- identify different upload paths and how the application handles them
- test how the application reacts to unusual filenames and formats

Example PHP Scripts

```
<?php echo "Current directory: " . getcwd(); ?>
```

```
<?php
echo "<pre>";
print_r($_GET);
print_r($_POST);
echo "</pre>";
?>
```

```
<?php
echo "<pre>";
print_r($_SERVER);
echo "</pre>";
?>
```

```
<?php echo "Server time: " . date("Y-m-d H:i:s"); ?>
```
